SecureSkin

Protecting the **Web**

SecureSkin protects your web applications and websites from cyber attacks.

SecureSkin is a software Web Application Firewall (WAF), blocking attacks and cloaking vulnerabilities.

Make your online presence secure with minimal time & effort:

- Standard rules for quick implementation

- Easily configurable to give you complete control

- React to new threats quickly

- No application changes – works for third party and cloud/SaaS

SecureSkin has been proven to block a broad range of automated and targeted attacks and cloaks/hides application vulnerabilities.

SecureSkin does not require changes to the site/ application and works remotely (as a proxy) to stand -off threats, insulate third party systems, secure legacy applications and add to a Defence in Depth architecture.

- OWASP Top Ten threats

- Code injection

- SQL injection

- OS command injection (& shellshock)

- Server cloaking

- Cross-site scripting

- Securing cookies

- Anti-Clickjacking

- HTTP verb validation

- HTTP responses made generic & blank

- Folder blocking and listing prevention

- Cross Site Request Forgery tokens

- Host header validation

- And many more….

SecureSkin can be deployed to the cloud or as a local agent on your network to meet your preference and security requirements. It is quick to implement, configurable, works for all web technologies and provides a universal solution that is completely under your control.
